

Video 1 · Welcome to V_Narah

Channel intro script — funny + informative

Target 3:00 | ≈ 440 spoken words | Host: Sreya | Channel: @VnarahDev

0:00–0:20 Cold open

On screen: You sit down, look at camera, holding the Raspberry Pi Zero.

"Hey guys, welcome! So... my résumé had a gap in it.
And instead of filling that gap with Netflix, I thought — why not fill it with projects?"

(Hold up the Pi.) "This tiny thing is going to help me."

Alternative opening (if posted before Oct 5): "Hey guys, welcome! Right now I'm officially... jobless. *(pause)* Or as I like to call it, 'self-funded research and development.'"

0:20–0:50 Who I am

On screen: Banner. Lower-third: **Sreya · V_Narah**.

"I'm Sreya, and this is V_Narah. I've been a programmer, I've done IT support and on-site service, and I've worked in operations — which basically means I've fixed computers, fixed code, and fixed people's bad days."

"So I decided to use this time to rewind my skills and actually use them — build new stuff, and make a little difference in a world that already has... well, everything. Except maybe this."

0:50–1:30 The mission: AI + hardware + real problems

On screen: Banner tags pop in one by one — AI Coding · IoT · Networking · Business Strategy.

"Here's the plan: I'm using AI to make technology simpler and easier for people who don't have big budgets — small businesses, agriculture, perishable goods, whoever needs it."

"And it's not just software. I'm bringing my hardware side too — IoT devices, gadgets, sensors, little computers. Basically some crazy tech-and-software combinations."

(Beat.) "At least, I *hope* they work. If they don't, you'll see that too. Live. On camera. No edits." *(Cut.)* "...Okay, some edits."

1:30–2:20 First project: Chedam

On screen: Architecture sketch — Pi hub in the middle, till / phone / laptop around it, internet as a dashed line.

"First project: Chedam. Small stores pay monthly fees for their POS systems, and when the internet goes down — they can't sell. Perishables? Expiry dates? Most cheap tools just don't care."

"Chedam runs a whole store on a tiny hub like this one, over the shop's own Wi-Fi: sales, stock, expiry dates, staff, suppliers. All the numbers show up as charts, so the owner sees profit and loss at a glance. No subscription. And the internet is optional."

(Hold the Pi next to your phone.) "Smaller than my phone. More responsible than my phone."

2:20–2:45 What you'll learn here

On screen: Quick montage — spec PDFs, the Pi, code editor (code blurred).

"On this channel you'll see the whole process: how I talk to AI, what it gets right, where it argues with me, and where I argue back. Plus networking, hardware that runs 24/7, and the business side: what owners actually pay for. After Chedam: agriculture, logistics, payroll — whatever problem looks fun to break."

2:45–3:00 Call to action

On screen: Face cam, then end screen.

> "So if you're into AI, gadgets, or you just want to watch someone turn a career gap into a career map — subscribe and stick around."

> "Next video: why I picked this idea, and how AI helped me plan it. And if you run a small business, comment the one tech problem that drives you crazy. I might build it."

> *(Wave.)* "See you in the build!"

Delivery tips

- **Pause after every joke** — one beat of silence does more than talking faster.
- **Jump cuts** after "No edits... okay, some edits" make the joke land.
- **Use the Pi as a prop** throughout — it's your running visual gag.
- About 440 words ≈ 3 minutes at a relaxed pace. If it runs long, cut the "fixed people's bad days" line first.
- Before recording: hide Wi-Fi passwords, SSH keys, the hub IP, tokens and any code.
